

Case 1: Asymmetrical development of eye leading to left eye looking smaller than right eye, 1 year old female.

The Person & complaint

- A one year old female girl presented with asymmetrical eye development suddenly leading to the left eye looking smaller than the right eye.
- Her eyes were normal from birth and had no incidence of accident or abuse
- She had always been a poor eater and is on the small side physically .
- She looked weak always and not very active but was a happy girl well loved
- She had visited paediatric eye specialist and been tested and examined but could not find anything wrong with her left eye. One eye specialist even gave a scare about the possibly of tumours behind eye and suggested MRI scan

The Story & Emotions.

No stories and emotions appeared to be involved in this case

The Energetic System

- There appeared to be an energy blockage in the left eye ball areas. Due to the fact that one eye is perfect , it is most likely that energy blockage is only locally on the left side.

Treatment : Done while child was asleep

First session.

Resonance to BL1, BI2, TH23 , GB1 for 20 minutes to each point. while she was asleep at night. The points open up quite easily but no significant improvement seen.

Second session 2 to session 20

Resonance to her left eyes with the full intention of love. Between session 2 to 19 , the energy of the whole eye ball was very contracted like a stone. Resonance was done for about an hour in each of this session. No improvement was observed.

Session 20

Due to love and persistence, resonance was again done to her left eye when she was sound asleep. On this occasion, the blockage was completely released as an explosion was felt literally on the practitioner's palm and was indeed frightening. Significant improvement was seen after session 20 due to persistency.

Result

The patient followed through with a three more short half hour session of resonance over the affected eyes. Follow up with her paediatric eye specialists showed marked improvement without an explanation by her specialist. This follow up session with the eye doctor was on six monthly basis for more than one and a half years and was finally diagnosed as normal .
