

Case 4: Worsening Seizures for two and a half years old child

The Person and Complaint

A girl two and a half years old presented with worsening seizures. Her parents were very stressed and worried about her condition. She had been prescribed multiple anti-epileptic drugs by her specialist, Epilim Ec 200mg, Sabril 500mg, lamotrigine and her seizures had not improved. She suffered bouts of seizures that led her to fall and knocked her head causing extensive swelling and bruising. There was no warning and some days she would suffer ten seizures. She had visited countless doctors and specialists but with no diagnosis for the condition via MRI scan, and her parents were willing to try anything. She was even blessed by the priest regularly and the church prayed for her regularly.

The Story & Emotion

The girl was very active and never stop doing something when not having seizure. She is hyperactive and woke up early every morning. She had poor concentration. She even suffered mild seizure while sleeping. She looked blank in her face, did not display creativity and there was no connection when people spoke to her. She displayed lack of understanding and showed no emotions.

The Energetic System.

Her Brow (chochma) charka potentially is blocked. The sephira from Kether to chochma and Kether to Binah as well as chochma to binah were potentially blocked. Also tipareth to kether may be blocked. Da'at the sephira from the union of chochma to Binah was also affected.

Treatment

First session.

Resonance on the sephira of chochma and binah for 30 minutes each while she was asleep. Following first session, her frequency of seizures was reduced by half from ten per day to 5 per day. The parents rang and was emotionally moved by the result. She was advised to have two sessions per week and that was agreed upon.

Second session

Resonance from chochma to Binah was done for 20 minutes each. Then resonance was done to her crown for 25 minutes. More improvement was shown and her frequency of seizure was down to three per day.

Third Session

Resonance to the sephira of Kether, Chochma and Binah to make sure they are all open. Then resonance from Chochma to Binah for 30 minutes. Following that she managed to keep her frequency of seizure to two to three per day. Some days, she actually did not have seizures.

Fourth session

Resonance from kether to chochma and from kether to binah for 30 minutes each until opened. Following that treatment, the feedback was that she did not suffer any seizure for a week. She was advised to come back for fifth session.

Fifth Session

Resonance to tipareth for 30 minutes, then resonance from tipareth to kether for half an hour. Following this, she did not suffer any more seizures. Her parents were advised not to stop her medications until fully assessed by her doctor. She was seizure free for three months and then her parents felt confident enough to withdraw her medication slowly one at a time over the next three months.

Results.

After six months from the start of treatment, all her medications were withdrawn by her parents without consent from her doctor and without recommendation by an energetic practitioner. However three months after withdrawal of all medications, she started to suffer few episodes of mild seizure again. She visited her specialist and was put back on the drug, Lamotrigine only but that did not control her seizure well. This time she was again put through more investigation using MRI scan again. The specialist discovered some anatomical disorder in her brain and suggested that an operation may help her. The puzzling thing was why couldn't they find anything wrong initially when she was put through the same test. Maybe the treatment helped review the anatomical abnormality in her brain. It was still unexplainable.

The decision to go through surgery was made by her parents and she underwent surgery with full recovery. She still stayed on low dose lamotrigine 25mg twice a day for a year before it was withdrawn completely. She is now well, looks normal and a happy girl.
